ACKNOWLEDGEMENT

This project would not have been successful without the kind support and help of many individuals and organization. I would like to extend my sincere thanks to all of them.

I express my deep sense of gratitude to Vice-Chancellor, PESU **Dr. K N B Murthy** and **Dr. Veena S**, Chairperson, Department of MCA for providing the platform and opportunity for IoT Application Development project.

I am highly indebted to **Mr. Santosh Katti**, Assistant Professor, PESU for his guidance and constant supervision as well as for providing necessary information regarding the project and also for his support in completing the project.

I would like to express my gratitude towards my parents for their kind co-operation and encouragement which helped me in completion of this project.

My thanks and appreciation goes to my teammates in developing the project and people who have willingly helped me out in different capacities.

It took 2 months to learn the concepts and develop the project. It is definitely worth remembering those precious moments when new ideas popped up in our minds.

We have worked hard to the best of our abilities and tried not to make any mistakes. If any are found, they are unintended.

Ayush Pratyay

Chinmay Prajapat

ABSTRACT

The objective of the project is to monitor hostile activities in the militarized zone. Therefore, as soon as the camera detects some activity within its range, it starts recording the surrounding area. If it detects some suspicious activity, the camera will start focusing on that particular area under suspicion. The camera will then start running facial recognition software, match with the data stored in the database and check whether the person is hostile or not. If the person is hostile, it will immediately alert the authorities to take necessary actions. All the collected visuals will be stored on the cloud for future reference.

INTRODUCTION

OVERVIEW

This report discuss the result of the work done in 'Alerting the Authorities about Intruder' on Raspberry Pi. The project aims in creation of designing a camera module for solving the problem faced by soldiers at the border about intruder.

BACKGROUND AND MOTIVATION

Soldiers at the border face so many problems. However, the main problem are the security issues, which has been breached by infiltrators on the other side. Since soldiers cannot be posted at every location at the border, we are trying to provide a smart surveillance module that will work only when there is movement at border. It would be like hidden camera, which will not be seen by the infiltrator. It will only be known to the Authorities.

OBJECTIVE

The final goal of the project is to provide information about the movement at the border at particular distance.

1. The camera module will activate only when there is movement at the border. If motion is detected, PIR Sensor is activated and camera is turned on. It will be active and monitor the environment for 2 minutes. If hostile activity is detected it will alert the authorities, capture the image, and store it on the cloud.
2. PIR Sensor will work only from certain distance.

METHODOLOGY

To implement the above goals, the following methodology needs to be followed:

1. Specifying the camera-working module.
2. Specifying the working of PIR Sensor.
3. Specifying the Raspberry Pi model
4. Specify the version of python.

ANALYSIS

Based on the analysis and literature survey regarding the present difficulties faced by the military at the border about intruder, we decided to make this project as our IOT project to help the authorities to know about the activities that are happening at the border.

We made this possible by combining the camera and PIR Sensor at the border in which PIR Sensor will be activated after sensing any movement and it will make the camera active for visualizing and taking photos.

Secondly, we are also alerting the authorities by using buzzer that will activate along with the camera.

REQUIREMENT ANALYSIS:

SOFTWARE REQUIREMENTS:

- Raspbian OS
- **Front end:** PYTHON 3.7
- Dropbox

HARDWARE REQUIREMENTS:

- Raspberry Pi Model 3B
- Raspberry Pi Camera Module
- PIR Sensor
- Buzzer
- Jumper Wires

FUNCTIONAL REQUIREMENTS:

1. PIR Sensor detects if there is any movement in the environment.
2. Activates the camera module and start recording the surroundings.
3. Alert the authorities.
4. Stores the recorded visuals in Dropbox for future use.
5. Deactivates the camera after 2 minutes if no motion is detected.

NON-FUNCTIONAL REQUIREMENTS:

1. **Availability:** It can be used by any government agencies where entry is restricted like Militarized zone, border etc.
2. **Maintainability:** Maintenance is very less as sensors are of high quality.
3. **Performance:** The data collected by the sensors are accurate as sensors sense precisely hence providing good performance to the user.
4. **Simplicity:** Since the device will be used by naïve personals who may be from a non-technical and technical background, the components have been made user friendly so that there will be lesser human interaction needed in order to work.

TOOLS AND TECHNOLOGIES:

This product is built using Raspberry Pi 3 B, PIR Sensor, Dropbox and Python 3.7.

The Raspberry Pi 3 B Model is the earliest of the third-Generation. It is powered by a 1.2 GHz BROADCOM BCM2837 processor with BCM43438 wireless LAN. It also has Bluetooth capabilities.

A passive infrared sensor (PIR sensor) is an electronic sensor that measures infrared (IR) light radiating from objects in its field of view. They are most often used in PIR based motion detectors.

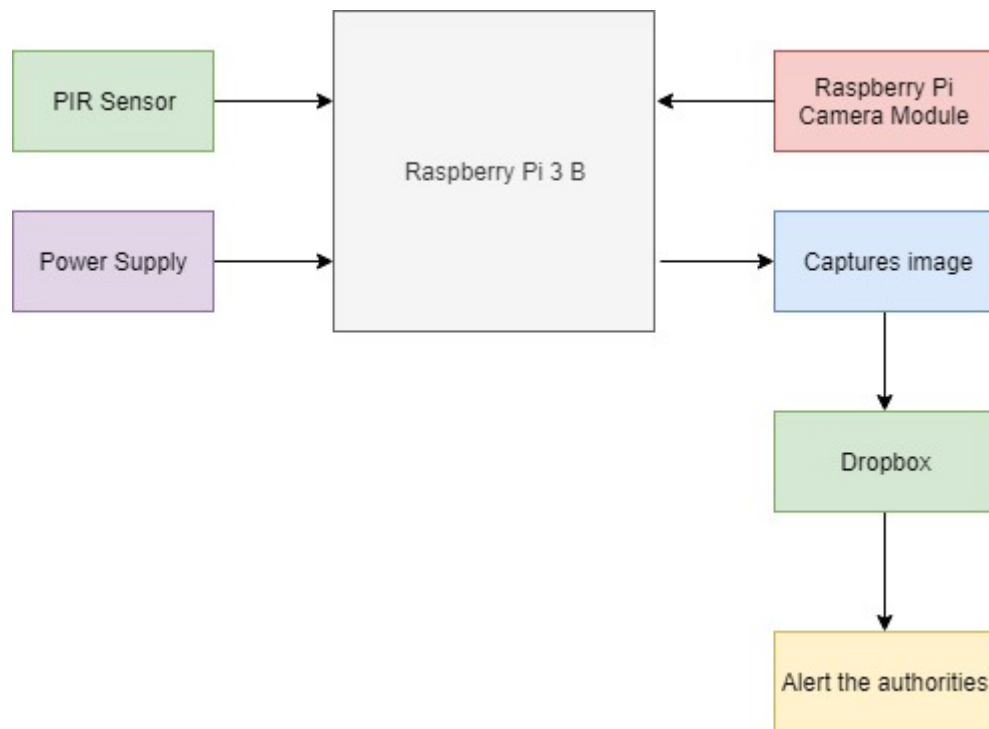

The Raspberry Pi Camera Module v2 is a high quality 5 megapixel Sony IMX219 image sensor custom designed add-on board for Raspberry Pi. It has the capability to record videos and take pictures at a resolution of 5 megapixels.

Dropbox is a file hoisting service operated by the American company Dropbox Inc. that offers cloud storage. Dropbox helps us to store the captured images onto the cloud.

TESTING

Test Case ID		1	Test Case Description		Test the Smart Surveillance Functionality						
Created By		Team	Reviewed By		-		Version		-		
QA Tester's Log											
Tester's Name		Team	Date Tested		12-May-2019		Test Case (Pass/Fail/Not Executed)		Pass		
S #	Prerequisites:				S #	Test Data					
1	Access to Smart Surveillance				1	Sensors					
2					2	Objects					
3					3						
4					4						
Test Scenario	Check whether the sensor activates on motion detection and starts monitoring the environment. If yes, then it should capture the image and store it on cloud.										
Step #	Step Details		Expected Results		Actual Results			Pass / Fail / Not executed / Suspended			
1	Access the smart Surveillance		Device is available		Device is available			Pass			
2	Trigger the device		ON		ON			Pass			
3	Sensor detects motion		Camera should get activated		Camera activated successfully			Pass			
4	Starts monitoring the environment		Camera should monitor the environment		Camera monitoring the environment			Pass			
5	Capture the image		Camera should capture the image of hostile person or object		Camera successfully captures the image			Pass			
6	Store the image on Cloud – Dropbox		The image must be stored onto the Dropbox		Image successfully stored into the Dropbox			Pass			
7	No motion detected after stipulated time		Device deactivates		Device deactivated successfully			Pass			

CONCLUSION

After analyzing the Indian-international borders we came to a conclusion that the main issue of our border is infiltrator because the borders are too vast and widespread. Hence, it is not possible to put individual army personnel everywhere on the border.

So finally, we came with an idea that by using modern technology such as IOT, it is very easy to build a project which can help the army personnel to keep an eye on the border like extreme geographic areas where it is hard to keep aware on the entire area.

FUTURE ENHANCEMENT

- Future enhancement of our project is to add Camouflage and LIDAR sensor to it.
- Internet of Things is a trending concept, which can increase the benefits of the smart surveillance by allowing it to adapt to the environment according to its changes ie if the Alligator is placed in the desert, it will change according to the desert's atmosphere. Similarly, if it is placed in snowy regions, it will adapt to that atmosphere. Also by replacing PIR sensor with LIDAR (Light Detection and Ranging), which is a remote sensing method that uses light in the form of a pulsed laser to measure ranges (variable distance) the alligator will be able to detect motion from farther distances and will be able to alert the authorities much beforehand.
- In order to run this integrated set of hardware we can use solar panels as an alternative to the battery, which will be needed to run the alligator once it is deployed.
