# UE17MC503 Database Management Systems

COURSE INSTRUCTOR: MR.P.SREENIVAS

EMAIL: SRINIVAS@PES.EDU

# Course Outline- Main Topics covered

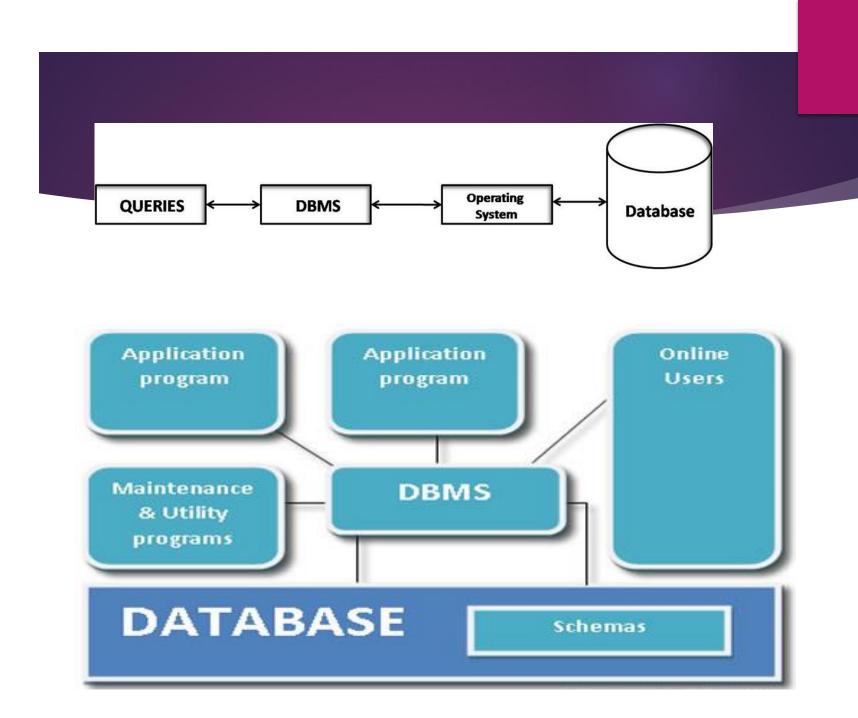

- The Introduction to Database and DBMS, Relational Data Model
- Entity, E-R Model and Entity Relationship
- Relational schema, Relational Algebra, SQL
- Normal forms, Normalization
- Indexing, Hashing and Tree Structures
- ▶ PL/SQL

#### Introduction to DBMS

- Purpose of Database Systems
- View of Data
- Data Models
- Data Definition Language
- Data Manipulation Language
- Transaction Management
- Storage Management
- Database Administrator
- Database Users
- Overall System Structure

# Database Management System (DBMS)

- Collection of interrelated data
- Set of programs to access the data
- DBMS contains information about a particular enterprise
- ▶ DBMS provides an environment that is both convenient and efficient to use.
- Database Applications:
  - ▶ Banking: all transactions
  - Airlines: reservations, schedules
  - Universities: registration, grades
  - Sales: customers, products, purchases
  - Manufacturing: production, inventory, orders, supply chain
  - Human resources: employee records, salaries, tax deductions
- Databases touch all aspects of our lives

#### **COMPONENTS OF DBMS**

Data Catalog Management

**Data Access** 

Prepared by Visakh V, Assistan

#### **Applications**

Transaction management

**Concurrency Control** 

Recovery management

Security management

Language Interface

**Storage Management** 

# Purpose of Database Systems

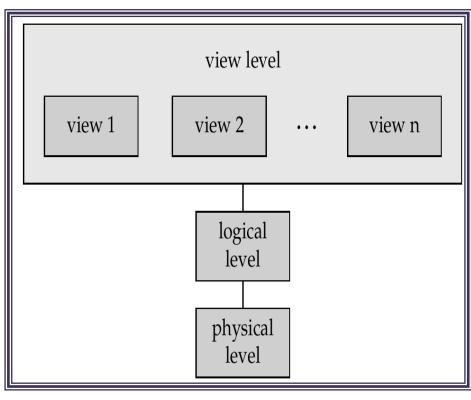

- In the early days, database applications were built on top of file systems
- Drawbacks of using file systems to store data:
  - Data redundancy and inconsistency
    - ▶ Multiple file formats, duplication of information in different files
  - Difficulty in accessing data
    - ▶ Need to write a new program to carry out each new task
  - Data isolation multiple files and formats
  - Integrity problems
    - Integrity constraints (e.g. account balance > 0) become part of program code
    - ▶ Hard to add new constraints or change existing ones

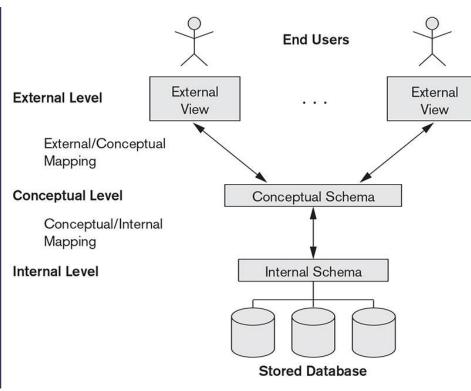

# Purpose of Database Systems (Cont.)

- Drawbacks of using file systems (cont.)
  - Atomicity of updates
    - Failures may leave database in an inconsistent state with partial updates carried out
    - ▶ E.g. transfer of funds from one account to another should either complete or not happen at all
  - Concurrent access by multiple users
    - Concurrent accessed needed for performance
    - Uncontrolled concurrent accesses can lead to inconsistencies
      - E.g. two people reading a balance and updating it at the same time
  - Security problems
- Database systems offer solutions to all the above problems

#### View of Data

#### An architecture for a database system

#### Levels of Abstraction

- Physical level describes how a record (e.g., customer) is stored.
- Logical level: describes data stored in database, and the relationships among the data.

View level: application programs hide details of data types. Views can also hide information (e.g., salary) for security purposes.

#### Instances and Schemas

- Similar to types and variables in programming languages
- Schema the logical structure of the database
  - e.g., the database consists of information about a set of customers and accounts and the relationship between them)
  - Analogous to type information of a variable in a program
  - ▶ Physical schema: database design at the physical level
  - ▶ Logical schema: database design at the logical level

#### Instances and Schemas

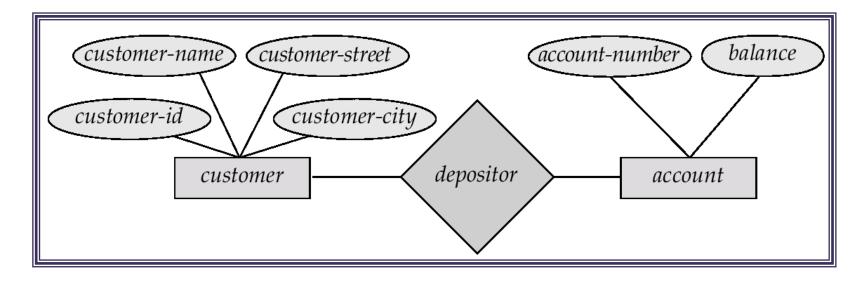

- Instance the actual content of the database at a particular point in time
  - Analogous to the value of a variable
- Physical Data Independence the ability to modify the physical schema without changing the logical schema
  - Applications depend on the logical schema
  - In general, the interfaces between the various levels and components should be well defined so that changes in some parts do not seriously influence others.

#### Data Models

- A collection of tools for describing
  - data
  - data relationships
  - data semantics
  - data constraints
- Entity-Relationship model
- Relational model
- Other models:
  - object-oriented model
  - semi-structured data models
  - Older models: network model and hierarchical model

# Entity-Relationship Model

Example of schema in the entity-relationship model

## Entity Relationship Model (Cont.)

- E-R model of real world
  - Entities (objects)
    - ▶ E.g. customers, accounts, bank branch
  - Relationships between entities
    - ▶ E.g. Account A-101 is held by customer Johnson
    - Relationship set depositor associates customers with accounts
- Widely used for database design
  - Database design in E-R model usually converted to design in the relational model (coming up next) which is used for storage and processing

#### Relational Model

Example of tabular data in the relational model

customercustomeraccount-Customer-id customerstreet city number name Johnson 192-83-7465 A-101 Alma Palo Alto **Smith** 019-28-3746 North A-215 Rye 192-83-7465 Johnson Alma Palo Alto A-201 321-12-3123 Jones Main Harrison A-217 Smith 019-28-3746 North A-201 Rye

**Attributes** 

# A Sample Relational Database

customer-id	customer-name	customer-street	customer-city	
192-83-7465	Johnson	12 Alma St.	Palo Alto	
019-28-3746	Smith	4 North St.	Rye	
677-89-9011	Hayes	3 Main St.	Harrison	
182-73-6091	Turner	123 Putnam Ave.	Stamford	
321-12-3123	Jones	100 Main St.	Harrison	
336-66-9999	Lindsay	175 Park Ave.	Pittsfield	
019-28-3746	Smith	72 North St.	Rye	
(a) The <i>customer</i> table				

account-number	balance	
A-101	500	
A-215	700	
A-102	400	
A-305	350	
A-201	900	
A-217	750	
A-222	700	
(b) The account table		

customer-id	account-number	
192-83-7465	A-101	
192-83-7465	A-201	
019-28-3746	A-215	
677-89-9011	A-102	
182-73-6091	A-305	
321-12-3123	A-217	
336-66-9999	A-222	
019-28-3746	A-201	
(c) The <i>depositor</i> table		

# Data Definition Language (DDL)

- Specification notation for defining the database schema
  - ► E.g.

- DDL compiler generates a set of tables stored in a data dictionary
- Data dictionary contains metadata (i.e., data about data)
  - database schema
  - Data storage and definition language
    - language in which the storage structure and access methods used by the database system are specified
    - Usually an extension of the data definition language

# Data Manipulation Language (DML)

- Language for accessing and manipulating the data organized by the appropriate data model
  - ▶ DML also known as query language
- Two classes of languages
  - Procedural user specifies what data is required and how to get those data
  - Nonprocedural user specifies what data is required without specifying how to get those data
- SQL is the most widely used query language

#### SQL

- ► SQL: widely used non-procedural language
  - ▶ E.g. find the name of the customer with customer-id 192-83-7465

select customer.customer-name

from customer

where customer.customer-id = '192-83-7465'

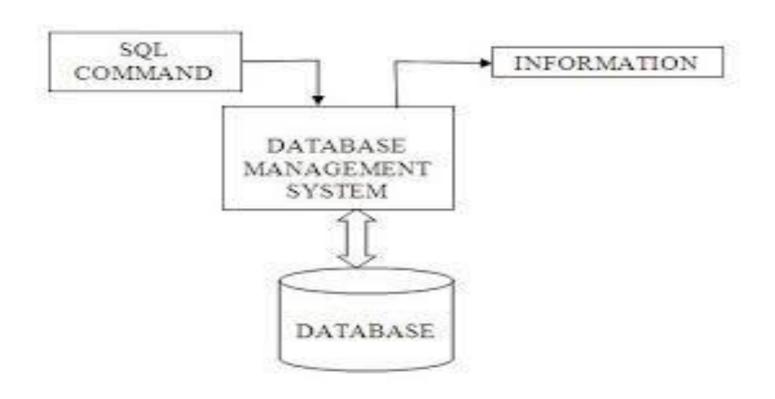

▶ E.g. find the balances of all accounts held by the customer with customerid 192-83-7465

select account.balance
from depositor, account

where depositor.customer-id = '192-83-7465' and depositor.account-number = account.account-number

- Application programs generally access databases through one of
  - Language extensions to allow embedded SQL
  - Application program interface (e.g. ODBC/JDBC) which allow SQL queries to be sent to a database

## Interaction of SQL with DBMS

#### Database Users

- Users are differentiated by the way they expect to interact with the system
- Application programmers interact with system through DML calls
- Sophisticated users form requests in a database query language
- Specialized users write specialized database applications that do not fit into the traditional data processing framework
- Naïve users invoke one of the permanent application programs that have been written previously
  - E.g. people accessing database over the web, bank tellers, clerical staff

#### Database Administrator

- Coordinates all the activities of the database system; the database administrator has a good understanding of the enterprise's information resources and needs.
- Database administrator's duties include:
  - Schema definition
  - Storage structure and access method definition
  - Schema and physical organization modification
  - Granting user authority to access the database
  - Specifying integrity constraints
  - Acting as liaison with users
  - Monitoring performance and responding to changes in requirements

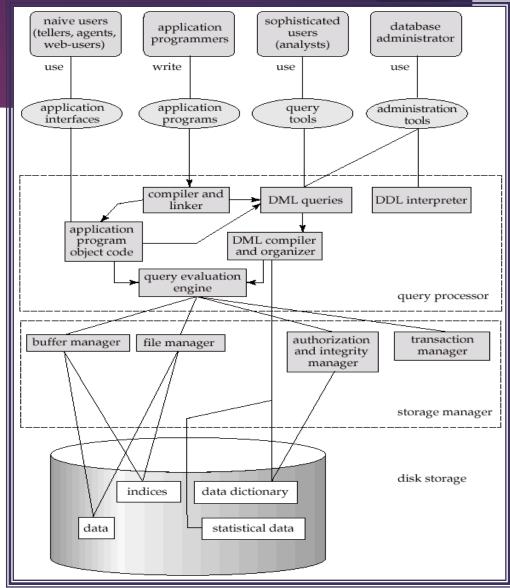

# Transaction Management

- A transaction is a collection of operations that performs a single logical function in a database application
- Transaction-management component ensures that the database remains in a consistent (correct) state despite system failures (e.g., power failures and operating system crashes) and transaction failures.
- Concurrency-control manager controls the interaction among the concurrent transactions, to ensure the consistency of the database.

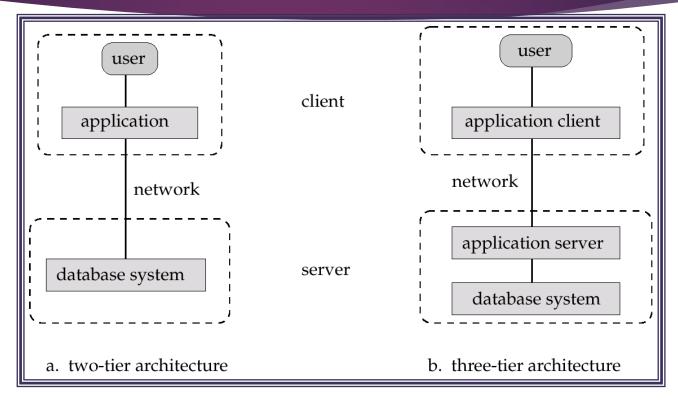

# Storage Management

- Storage manager is a program module that provides the interface between the low-level data stored in the database and the application programs and queries submitted to the system.
- The storage manager is responsible to the following tasks:
  - interaction with the file manager
  - efficient storing, retrieving and updating of data

# Overall System Structure

# Application Architectures

- ■Two-tier architecture: E.g. client programs using ODBC/JDBC to communicate with a database
- ■Three-tier architecture: E.g. web-based applications, and applications built using "middleware"
